

Meeting Agenda

Feedback:

- Beautiful slides, excellent motivating section, great mockup of the interface. Note that as you said user was the first concept you showed report, which is clearly the core concept! Do you need a way to merge reports? Also will be interesting to flesh out the OP of report: **how a report can end up being processed by the city, rejected, resolved etc. (comments from DNJ)**

User Engagement:

- How do requests come about?
 - Potentially an admin could confirm requests
 - Verify that one user has one account?
 - The fact that someone took the time and effort to make a request is important
 - Anyone can post requests that to them is important
 - Verification may be beyond the scope of our project

Neighborhood Concept:

- tag concept instead?
- Filter issues by multiple tags
- Tags users choose to subscribe to
- Distinctions between geographic tags and categorization tags for filtering logic
- Icons or colors on the map based on the different tags
- Either only set tags at the beginning of the issues or allow augmentation of tags on an issue post-creation.

Merging requests:

- We could potentially merge requests with the same latitude + longitude

Suggestions:

- Enumerate all concepts, create wireframes, and rank them
